                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       expressing recombinant proteins for analysis and are also useful as corresponded markers or tags to identify chromosomes or to map related gene combined immunoderical services and carbohydrate source. The proteins are useful as amino acid supplement, carbon comes in itrogen source and carbohydrate source. The proteins are useful for treating various immune deficiencies and disorders (e.g. multiple combined immunodeficiency (SCID)), autoimmune disorders (e.g. multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis), allergic reactions (e.g. asthma), myeloid or lymphoid cell deficiencies.

Consteoporosis or osteoarthritis, peripheral nervous system diseases (e.g. peripheral neuropathy, Allaheimer's diseases, Parkinson's disease), coagulation disorders, inflammatory diseases (e.g. systemic inflammatory coagulation disorders, inflammatory diseases (e.g. systemic inflammatory camphylaxis and hypersensitivity. Proteins are also useful for inducing tumour immunity, for inducing bone, carrilage, tendon, ligament and/or regenerating nerve and brain tissue, for inducing fertility and for regenerating nerve and brain tissue, for inducing fertility and for inhibiting tumour growth. Proteins are also useful as chemokine for useful as inhibitors of receptor/ligand interactions. The present sequence represents a oligonucleotide probe for a cDNA encoding a human of the protein are also useful as chemokine for a coagulation of the protein are also useful as chemokine for a coagulation of proteins are also useful as chemokine for a coagulation of proteins are also useful as chemokine for a coagulation of proteins are also useful as chemokine for a coagulation of proteins are also useful as chemokine for a coagulation of proteins are also useful as chemokine for a coagulation of proteins are also useful as chemokine for a coagulation of proteins are also useful as chemokine for a coagulation of proteins are also useful as chemokine for a coagulation of proteins are also useful as chemokine for a coagulation of prot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

Hypersensitivity diseases include Typ I hypersensitivities such as contact with allergens that lead to allergies. Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene intron splice site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

Autoimmune diseases include Addison's diseastrophic gastritis. Degenerative nervous system diseases include mul
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases
                                                                                             06-DEC-2001.

                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a human genome-derived myosin-like CC protein 1 (hdDMLP-1). The protein and polynucleotide sequences of hdDMLP-CC 1 can be used in gene therapy and vaccine production. The hdDMLP-1 CC nucleic acids can be used as probes to detect, characterise and quantify CC hdDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hdDMLP-1 CC protein variants having desired phenotypic improvements, and for expressing the proteins. The hdDMLP-1 proteins or polypeptides may be comed as immunogens to raise antibodies that specifically recognise hdDMLP-1 proteins, as standards in assays used to determine the concentration cand/or amount specifically of hdDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as that appeared to protein, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hdDMLP-1 may be used for diagnosing a CC disorder associated with the expression of hdDMLP-1, in particular heart cand skeletal muscle disorders. hdDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hdDMLP-1 sequence in the expression of hdDMLP-1.

CC The present sequence represents an oligomer used in the screening of the present invention. N.B. The sequence data for this patent did not form part of the printed capture with the screening observations of the printed of the printed sequence as obtained for expression of format directly from WIPO as the present sequence as obtained in electronic format directly from WIPO as the printed sequence in the screening of the printed sequence as obtained for expression of the printed sequence in the screening the screening of the printed sequence in the screening that the screening the screening the screeni
                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                              The present invention describes a human genome-derived myosin-like CC protein 1 (hGMMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 cC nucleic acids can be used as probes to detect, characterise and quantify CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 cC protein variants having desired phenotypic improvements, and for cused as immunogens to raise antibodies that specifically recognise hGDMLP-1 cused as immunogens to raise antibodies that specific blomolecule capture probes for surface-enhanced laser description ionisation, as charaction, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The complement in patients having specific deficiency in hGDMLP-1 cproduction, and in vaccines or for replacement therapy. The chispated with the expression of hGDMLP-1, in particular heart cand skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart cand skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. characteristication, but was obtained in electronic format directly from WIPO at figure in the screening of the specification, but was obtained in electronic format directly from WIPO at figure in the printed directly from WIPO.

The present invention describes a human genome-derived myosin-like protein 1 (hdpMLP-1). The protein and polynucleotide sequences of hdpMLP-1 can be used in gene therapy and vaccine production. The hdpMLP-1 mucleic acids can be used as probes to detect, characterise and quantify hdpMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hdpMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hdpMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hdpMLP proteins, as standards in assays used to determine the concentration and/or amount specifically of hdpMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hdpMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hdpMLP-1 may be used for diagnosing a disorder associated with the expression of hdpMLP-1, in particular heart can also be accepted to the concentration of the particular heart can be accepted to the concentration of the particular heart can be accepted to the concentration of the particular heart can be accepted to the concentration of the particular heart can be accepted to the concentration of the particular heart can be accepted to the concentration of the particular heart can be accepted to the concentration of the particular heart can be accepted to the concentration of the particular heart the concentration o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Best Local Similarity
                                                                                  The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the representation substrates, to provide initial substrates for the protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLF-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific blomolecule capture probes for surface-enhanced laser description ionisation, as the protein of the prote
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         26-MAY-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify
                                                                                                                                                          New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                          ပ်

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to CC provide initial substrates for the recombinant engineering of hGDMLP-1 CC protein variants having desired phenotypic improvements, and for CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP -1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The colymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. CT he sequence data for this patient did not form part of the printed CC specification, but was obtained in electronic format directly from WIPO at figure in the screening of the printed control of the prin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The protein and polynuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as strandards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                     Human CLCA1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or issue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic arids of the invention are also used as disconcist that the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to enzymatic nucleic acid molecules that down cregulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition cassociated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 maken in a cell. This sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC given in the specification, a sequence containing at least 15 consecutive CC nucleotides from the 17 mer sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that CC hybridizes to them under highly stringent conditions, or the complement CC of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, e.g. as one CC production of recombinant polypeptides. Any of the nucleic acids, containing the vector or antibodies directed against the polypeptides are useful for CC proparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell CC diseases that are characterised by development of tumours or cell CC degeneration, specifically cancer but also Alzheimer's disease and CC diseases. The polypeptides can also be used to generate antibodies, and CC diseases. The polypeptides can also be used to generate antibodies, and CC chips. The nucleic acid sequences of the invention can be used in gene CC therapy. This polynucleotide sequence represents a tumour suppression crelated human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ5989 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66558 represent substrate/target sequences for the human ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                               RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme amberzyme; G-cleaver ribozyme; decoy molecule; agener; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HCV minus strand DNAzyme substrate sequence #1044.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ACD63405 standard;
          Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                    (RIBO-)
                                                                                                                                                                                                                                                                                          26-MAR-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 54
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, C inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene capression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to nucleic acid molecules which modulate Ct the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, C inozymes, zinzymes, and G-cleaver ribozymes, DNAzymes, C inozymes, zinzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV C DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV invention or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

CC enzyme recognition site is a palindromic sequence or a non-palindromic CC sequence, or is an interrupted sequence. The target polynucleotide CC sequence comprises an antibody variable region or an antibody cCC hypervariable region. The first and second primers specifically hybridise CC to the region encoding an antibody framework region. In preparing a CC library, the library vehicle comprises a cloning vector, particularly a CC phage display vector, a bacterial vector or a yeast vector. Particularly a CC alternatively, the library vehicle comprises a nucleic acid that encodes CC alternatively, the library vehicle comprises an antibody scaffold or a coat protein. The library vehicle comprises an enzyme, a heterologous protein, a green fluorescent protein (GFP) CC scaffold or a coat protein. The library vehicle comprises an incomprise consprises a ribosome. The step of linking the amplified product comprises of ligating an adaptor oligonucleotide to the amplified product to form a CC linked amplified product, and amplifying the linked ligated product. The method is useful in amplified product. The sequences on the amplified product. The method may be used for detecting CC human pathogens, detecting human genetic polymorphisms, detecting RNA and CC mensics, paternity testing, and disease diagnosis. The present sequence CC represents a PCR primer used to demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the amplified product with first and second restriction enzymes to obtain the amplified product that is free of amplification primer sequences. Also included is a method of preparing a library, comprising performing the steps of preparing an amplified product that is free of amplification primer sequences and then linking the amplified product to a library vehicle. In the above methods, at least one restriction enzyme cleaves at 2 sites at a distance from its recognition site. At least one restriction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of preparing an amplified product that is free of amplification primer sequences comprising amplifying the target nucleic acid sequence in an amplification reaction, and cleaving
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequences, useful for detecting pathogens, comprises amplifying a target nucleic acid sequence and cleaving the amplified product with restriction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 4;

                                        The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a polynuclectide isolated from gene and is useful for detecting a single nuclectide polymorphic human gene or for diagnosing of disease. The invention enables detection of a single nuclectide polymorphism in a human gene. present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                      Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                               Blatt

                                                                                                                                             Sequence
                                                                                                                                                                                                 The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                      from hepatitis C virus (HCV), useful for the tree especially in combination with type I interferon
                                                                                                                                                                                                                                                                                                                                                                                                        Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;

The present invention describes the tobacco ethylene insensitive 3 (EIN3)-like protein, designated TEIL, isolated from Nicotiana tabacum cv Samsun NN. The transcription factor is used to impart environmental stress resistance to plants by transformation with the gene for the transcription factor; and screening potential inhibitors of the expression of ethylene-inducible genes in plants. AAZ95383 to AAZ95476 represent oligonucleotides used in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Best Local Similarity Matches 12; Conserv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                in the embryo and foetus, and is also strongly expressed in cancer cells. The invention also relates to recombinant vectors and host cells comprising gene 584 nucleic acids, the recombinant expression of the 584 protein, methods of screening for modulators of 584 activity or expression, and the compounds thus identified. The human and mouse 584 genes represent a novel gene target for the development of drugs useful in the treatment of diseases such as cancer. The present sequence represents a PCR primer used in the isolation of human gene 584 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel frizzled family gene, 584, from mouse and human (cDNAs given in AAF75973 and AAF75974), and to the mouse and human 584 proteins (AAB73307, AAB73308). Gene 584 is strongly expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel frizzled family genes 584 strongly expressed in embryo and well as in cancer cells, useful in drug development for diseases
                                                                              Novel polynucleotide useful for PCR amplification along with two fragment from another set of sequences, or for detecting single
                                                                                                                                                                                                                                                                                                   08-MAR-2002; 2002JP-00064373
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       human; single nucleotide polymorphism;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                   (NOVS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WO2004022075-A1
                                                                       Example;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     modified_base

           Treating or ameliorating neurological disorders e.g., cancer pain, osteoarthritis pain, allodynia or hyperalgesia comprises injecting subject a double-stranded RNA that inhibits the expression of a target subject and the expression of a target subject and the expression of a target subject and target subject subj
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -stranded (ds) RNA that inhibits the expression of a target gene. Also described is, a pharmaceutical composition comprising a dsRNA inhibiting the expression of P2X3 or P2X2 for treating chronic pain. The dsRNA that inhibits the expression of a target gene has analgesic activity, and can be used in gene therapy. The method is useful for treating or ameliorating chronic pain, e.g., cancer pain, osteoarthritis pain, allodynia or hyperalgesia. The present sequence represents a rat P2X3 antisense oligonucleotide, which is used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method for treating or ameliorating neurological disorders, which comprises injecting into a subject a double stranded (ds) RNA that inhibits the expression of a target gene. Also described is a pharmaceutical composition comprising a dsRNA inhibiting the expression of P2X3 or P2X2 for treating chronic pain. The dsRNA that inhibits the expression of a target gene has analgesic activity, and can be used in gene therapy. The method is useful for treating or ameliorating chronic pain, e.g., cancer pain, osteoarthritis pain, allodynia or hyperalgesia. The present sequence represents a rat P2X3 antisense oligonucleotide, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                   29-JAN-1992;

The sequences given in AAQ47539-50 are probes which were used in the quantification of human GTP binding protein (G protein)-specific mRNAs. These probes are based on sequences derived from human and rat G-proteins. These probes were used in the method of the invention for the detection and quantification of mRNAs in a sample without the need to purify the mRNA from cells. The claimed method comprises identifying a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Probe; quantification; human; GTP binding protein; G protein; alpha subunit; specific mRNA; detection; hybridisation; diagnosis; pathophysiology; disease state; hereditary; cancer; infectious;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cc polynucleotide sequence unique to the mRNA, and immobilising an oligomer cc complementary to this sequence to an insoluble support. The sample is then incubated with the insoluble support such that the unique sequence cc will hybridise to the bound oligomer and be immobilised. Non-immobilised components are washed from the support and bound RNA is labelled in such ca way that the label is incorporated onto the support relative to the camount of mRNA on the support. The amount of bound label is then cd etermined. This method can be used for the reliable, rapid, simultaneous cquantification of multiple varieties of mRNA. It may be used for cd dagnosing and recognition of pathophysiology of various disease states, eg. hereditary diseases, cancer, and infectious diseases. G proteins are thought to be involved in causing various disease states. A genetic certiciency of Gs protein is the molecular basis of hereditary of cs proteins of proteins are also involved in invasive and meteastatic melanoma cells, and diabetes. See also AAQ47381-666.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                          This sequence is a primer that was used to construct the antibody of the invention. The antibody is an anti-CEA (carcinoembryonic antigen) antibody (806.077 Ab). Host cells or transgenic organisms transformed with DNA encoding the antibody, are used to make the antibody or conjugate. The conjugate is used in a medicament suitable for intravenous administration. The conjugate can be used for cancer therapy, selectively killing tumour cells. The antibody can be used for in vivo or in vitro

                                                                                                                                                                                                                                                                                                                   The primers AAV41785-V41794 were used in the cloning of human pancreatic carboxypeptidase B (CPB). The co-expression of a modified pro-domain of CPB from a seperate gene enhances enhance expression. This process can be used to produce recombinant CPB in eukaryotic cells, or fusions of CPB with antibody chains. CPB is used in insulin production and protein seguencing, while its fusions with antibody are useful in antibody-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New modified pro-domain of carboxy-peptidase B - enhances expression co-expressed proteins for production of recombinant carboxy-peptidase its fusions with antibodies, used, e.g. in enzyme prodrug therapy.
                                                                                                                                                                                                                Sequence 19
                                                                                                                                                                                                                                                                directed enzyme prodrug therapy. The Modified pro-domain provide increased yields of recombinant CPB, possibly by protecting the C-terminus against enzymatic degradation or by increasing intracellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WO9835988-A1

                                                                                                                                                                                                                                                                                                                         nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         short interfering nucleic acid; siNA; breakpoint cluster region; v-abl Abelson murine leukaemia viral oncogene homologue 1; BCR-ABL; cytostatic; leukaemia; lymphoma; human; ss; siRNA; ABL1.

The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      05-SEP-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFS encode polypeptides (see AAY3673-437349) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as monogenococcal uretritis, perincepathy in breast feeding infants; and venercal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94584- AAX95879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising
AAX91991-X97517 represent PCR primers used to amplify open reading fram and other nucleic acid sequences from the genome of Chlamydia pneumonia (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, crythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584- AAX35879) can be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ន្តន្តន្តន្ត្
        targeted to the 5'-untranslated region or 3'-untranslated region of a nucleic cranslational termination region or 3'-untranslational start site, it acid encoding a p38 mitogen activated protein kinase (MAPK), where the antisense oligonucleotides inhibit the expression of MAPK), where the antisense oligonucleotides inhibit the expression of MAPK), where the antisense oligonucleotides inhibit the expression of MAPK), where the AAC79480 and AAC79500 and AAC7953 - AAC79570 represent human p38alpha MAPK and p38beta MAPK cDNA sequences. AAC79510 - AAC79500 and AAC7953 - AAC79572 and p38alpha antisense oligonucleotides, while AAC79502 - AAC79521 and antisense oligonucleotides AAC79502 - AAC79523 and antisense oligonucleotides AAC7953 - AAC7953 and antisense oligonucleotides AAC7953 and antisense oligonucleotides are ap8alpha cDNA sequence AAC79523 and antisense oligonucleotides are given in AAC79537 and antisense oligonucleotides have antirheumatic; antiarthritic; immunosuppressive; cardiant and antiinflammatory activity. The antisense oligonucleotides have antirheumatic; antiarthritic; calls or tissues. The oligonucleotides are used for treating an animal with diseases such as inflammatory or autoimmune diseases e.g. rheumatoid arthriting or heart disease. The oligonucleotides are also useful for inhibiting the expression of p38 MAPK in the particle of the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                       PCR primers AAF80035-36 were used to detect the genotype of human Cf families. The specification describes an odorant binding polypeptide (OBP). OBPs provide long-term retention (gradual release) of lipophilic compounds, so prolong the 'hold' of perfumes, deodorants etc. OBP polypeptides are used as binding proteins for hydrophobic ligands (particularly odorants); as competitive inhibitors (agonists or controlling the controlling proteins for hydrophobic ligands (particularly odorants); as competitive inhibitors (agonists or antipodies for diagnosis of allergy, asthma or cancer; for controlling coldinistion of an odorant, specifically in perfumes, cosmetics or diainfectant compositions, to screen compounds, especially odorants or flavours, e.g. human pheromones, for binding to OBP, also in analysis of complex perfume mixtures; to solubilite lipophilic compounds; for treating hyperlipidemia or obesity, or to supplement non-maternal milk when combined with nutritional fatty acids, as food additives; as a collayed release) but also for delivery across the nlacental barvier (e.g., collayed release) but also for delivery across the nlacental barvier (e.g., collayed release) but also for delivery across the nlacental barvier (e.g., collayed release) but also for delivery across the nlacental barvier (e.g., collayed release) but also for delivery across the nlacental barvier (e.g., collayed release) but also for delivery across the nlacental barvier (e.g., collayed release) but also for delivery across the nlacental barvier (e.g., collayed release) but also for delivery across the nlacental barvier (e.g., collayed release) but also for delivery across the nlacental barvier (e.g., collayed release) but also for delivery across the nlacental barvier (e.g., collayed release) but also for delivery across the nlacental barvier (e.g., collayed release) but also for delivery across the nlacental barvier (e.g., collayed release) but also for delivery across the nlacental barvier (e.g., collayed the delivery across the nlacent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Best

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                The specification describes a human embryo-derived (EBD) cell culture that comprises cells which simultaneously express polypeptide or mRNA markers that are characteristic of at least 2 different cell types. The cell types are ectodermal, mesodermal, and/or endodermal cells. The markers include nestin, vimentin, myf6, myosin light-chain 2 ventricular isoform, flk1, alpha-1 fetoprotein and GATA-4. The EBD cells are useful in cell culture, tissue transplantation, tissue engineering, drug discovery and gene therapy. They are especially useful in transplantation therapies for the treatment of Parkinson's disease, amyotrophic lateral sclerosis, stroke, injury to motor neurons, including spinal cord injury, and disbetes. Human EBD cells can be implanted into the central nervous
                                                     system for the treatment of disease or physical brain injury, such as ischemia or chemical injury, as well as to treat diseases of cardiac, skeletal or smooth muscles, liver, pancreas, eyes, vascular diseases, trepopulate bone marrow, in organotypic co-culture, in the biosynthetic production of macromolecules, and in the construction and testing of human artificial chromosomes. AAH42612-85 represent PCR primers and probes for markers of human cells. They were used to examine the mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human embryo-derived cell culture comprising cells that simultaneously express polypeptide or mRNA markers that are characteristic of at least cell types, useful in tissue transplantation, drug discovery, gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                         The present invention relates to a new method of interfering with G2/M C checkpoint function in cells exposed to a genotoxic stress thus cinhibiting p53-mediated apoptosis in a cell exposed to genotoxic stress. The method of the invention involves inhibiting p38 mitogen-activated protein kinase (MAPK) activity in the cell and thus interfering with G2/M checkpoint (cell division) function. The invention can be used for interfering with G2/M checkpoint function in cells (e.g. tumour, non cultumour or cardiac cells) exposed to a genotoxic stress, and thus chibiting p53-mediated apoptosis in a cell exposed to genotoxic stress. The method of the invention can also be used for treating a tumour in a culturation can also be used for treating a tumour in a culturation can also be used for treating a condition can concern the cell exposed to genotoxic stress. The methods of the invention are suitable for enhancing the efficacy and safety of genotoxic interapy. The present mucleic acid sequence represents synthetic p38 beta antisense (AS) oligonucleotide concerns the methods of the invention for antisense suppression of p38 MAPK expression in human cancer cells
